## ABSTRACT OF THE DISCLOSURE

| An illuminated computer keyboard has a transparent layer, a resilient               |
|-------------------------------------------------------------------------------------|
| member, multiple printed circuit boards, an illuminant board and a casing to hold   |
| the foregoing elements. The transparent layer has multiple keys. The resilient      |
| member is mounted under the transparent layer, is translucent and has multiple      |
| resilient protrusions corresponding respectively to the keys in the transparent     |
| layer to press the keys against the transparent layer. The multiple printed circuit |
| boards are mounted under the resilient member, are translucent and connect the      |
| keys electrically to the computer. The illuminant board is mounted under the        |
| multiple printed circuit boards and is powered by a power supply. When the          |
| illuminant member is illuminating and light passes through the transparent layer,   |
| the keyboard can be clearly seen and used in the dark.                              |
